

IN THE CLAIMS

Please amend the claims as follows:

Listing of Claims

1. (Currently Amended) A hydrogen generator comprising:
 - a first tubular wall element;
 - a second tubular wall element disposed outside said first tubular wall element and coaxially with said first tubular wall element;
 - a tubular water evaporator defined by said first tubular wall element as an inner wall thereof and said second tubular wall element as an outer wall thereof;
 - a tubular reforming catalyst body provided in a tubular space formed between said first and second tubular wall elements, said water evaporator and the reforming catalyst body being arranged in an axial direction of said first and second tubular wall elements;
 - a water inlet from which water is supplied to said water evaporator, said second tubular wall element being provided with said water inlet; and
 - a feed gas inlet from which a feed gas is supplied to said water evaporator, said second tubular wall element being provided with said feed gas inlet;
 - a burner configured to combust a combustible gas to generate a combustion gas;
 - a third tubular wall element disposed inward of said first tubular wall element and coaxially with said first tubular wall element, the combustion gas being caused to flow in a

tubular space which is a combustion gas passage formed between said first and third tubular wall elements; and

a width equalizing means for reducing a variation in a width of the combustion gas passage to equalize the width over an entire region in a circumferential direction of the combustion gas passage, wherein:

 said hydrogen generator is configured to cause a gas mixture containing steam and the feed gas to flow from said water evaporator to said reforming catalyst body and to reform the gas mixture into a reformed gas containing hydrogen; wherein:

 the water inlet and the feed gas inlet are configured to inject the water and the feed gas so as to contact said tubular water evaporator at locations a location separate from one another.

2. (Original) The hydrogen generator according to claim 1, wherein the reformed gas is caused to flow from an axial end of said reforming catalyst body.

3. (Original) The hydrogen generator according to claim 2, wherein said water evaporator is disposed under said reforming catalyst body.

4. (Original) The hydrogen generator according to claim 1, wherein said first and second tubular wall elements are each constructed of a cylindrical seamless pipe.

5. (Canceled)

6. (Currently Amended) The hydrogen generator according to ~~claim-5~~ claim 1, wherein said burner is oriented to cause a flame to be emitted upward from said burner.

7. (Currently Amended) A ~~The~~ hydrogen generator comprising: ~~according to claim-6,~~
a first tubular wall element;
a second tubular wall element disposed outside said first tubular wall element and
coaxially with said first tubular wall element;
a tubular water evaporator defined by said first tubular wall element as an inner wall
thereof and said second tubular wall element as an outer wall thereof;
a tubular reforming catalyst body provided in a tubular space formed between said first
and second tubular wall elements, said water evaporator and the reforming catalyst body being
arranged in an axial direction of said first and second tubular wall elements;
a water inlet from which water is supplied to said water evaporator, said second tubular
wall element being provided with said water inlet; and
a feed gas inlet from which a feed gas is supplied to said water evaporator, said second
tubular wall element being provided with said feed gas inlet, wherein:
said hydrogen generator is configured to cause a gas mixture containing steam and the
feed gas to flow from said water evaporator to said reforming catalyst body and to reform the gas
mixture into a reformed gas containing hydrogen; and
the water inlet and the feed gas inlet are configured to inject the water and the feed gas so
as to contact said tubular water evaporator at locations separate from one another,

said hydrogen generator further comprising:

a burner configured to combust a combustible gas to generate a combustion gas;

a third tubular wall element disposed inward of said first tubular wall element and

coaxially with said first tubular wall element, the combustion gas being caused to flow in a

tubular space which is a combustion gas passage formed between said first and third tubular wall

elements; and

a first lid element disposed with a gap between said first lid element and an upper end of

said third tubular wall element so as to close an upper end of said first tubular wall element,

wherein said burner is disposed in an internal space of said third tubular wall element and the

combustion gas generated in said burner is caused to flow from an interior of said third tubular

wall element into the combustion gas passage through the gap.

8. (Currently Amended) A ~~The~~ hydrogen generator comprising: according to claim 7,

a first tubular wall element;

a second tubular wall element disposed outside said first tubular wall element and

coaxially with said first tubular wall element;

a tubular water evaporator defined by said first tubular wall element as an inner wall

thereof and said second tubular wall element as an outer wall thereof;

a tubular reforming catalyst body provided in a tubular space formed between said first

and second tubular wall elements, said water evaporator and the reforming catalyst body being

arranged in an axial direction of said first and second tubular wall elements;

a water inlet from which water is supplied to said water evaporator, said second tubular wall element being provided with said water inlet; and

a feed gas inlet from which a feed gas is supplied to said water evaporator, said second tubular wall element being provided with said feed gas inlet, wherein:

said hydrogen generator is configured to cause a gas mixture containing steam and the feed gas to flow from said water evaporator to said reforming catalyst body and to reform the gas mixture into a reformed gas containing hydrogen; and

the water inlet and the feed gas inlet are configured to inject the water and the feed gas so as to contact said tubular water evaporator at locations separate from one another,

said hydrogen generator further comprising:

a burner configured to combust a combustible gas to generate a combustion gas; and
a third tubular wall element disposed inward of said first tubular wall element and
coaxially with said first tubular wall element, the combustion gas being caused to flow in a
tubular space which is a combustion gas passage formed between said first and third tubular wall
elements, wherein:

said first tubular wall element is provided with a combustion gas outlet through which the
combustion gas flowing in the combustion gas passage is guided to outside, and a combustion-
gas exhaust pipe is connected to said first tubular wall element to allow the combustion gas
flowing out from the combustion gas outlet to be guided radially and downward of said first
tubular wall element.

9. (Withdrawn) The hydrogen generator according to claim 7, further comprising a width equalizing means for reducing a variation in a width of the combustion gas passage to equalize the width over an entire region in a circumferential direction of the combustion gas passage.

10. (Withdrawn) The hydrogen generator according to claim 9, wherein said width equalizing means includes a plurality of protrusions that have equal height and protrude from said third tubular wall element toward said first tubular wall element, and tip ends of the protrusions are configured to contact said first tubular wall element.

11. (Withdrawn) The hydrogen generator according to claim 10, wherein the protrusions are formed on said third tubular wall element such that the protrusions are arranged to be spaced a predetermined distance apart from each other in a circumferential direction of said third tubular wall element.

12. (Withdrawn) The hydrogen generator according to claim 9, wherein said width equalizing means includes a flexible rod element that is disposed to extend in a circumferential direction of said third tubular wall element and has an equal cross-section, said rod element being sandwiched between said first and third tubular wall elements.

13. (Withdrawn) The hydrogen generator according to claim 12, wherein said rod element is a round rod having an equal diameter.

14. (Withdrawn) The hydrogen generator according to claim 1, wherein said first tubular wall element is provided with a porous metal film on an outer peripheral surface thereof, and said water evaporator has a water reservoir that is formed between the porous metal film and an inner peripheral surface of said second tubular wall element.

15. (Withdrawn) The hydrogen generator according to claim 14, wherein the porous metal film is provided over an entire outer peripheral surface of said first tubular wall element.

16. (Original) The hydrogen generator according to claim 4, further comprising:
a tubular cover that is configured to cover said second tubular wall element and forms a double-walled pipe along with said second tubular wall element, wherein the reformed gas flowing out from said reforming catalyst body is caused to flow a tubular space between said second tubular wall element and said tubular cover.

17. (Original) A The hydrogen generator according to claim 16, further comprising:
a first tubular wall element;
a second tubular wall element disposed outside said first tubular wall element and
coaxially with said first tubular wall element;
a tubular water evaporator defined by said first tubular wall element as an inner wall
thereof and said second tubular wall element as an outer wall thereof;

a tubular reforming catalyst body provided in a tubular space formed between said first and second tubular wall elements, said water evaporator and the reforming catalyst body being arranged in an axial direction of said first and second tubular wall elements;

a water inlet from which water is supplied to said water evaporator, said second tubular wall element being provided with said water inlet; and

a feed gas inlet from which a feed gas is supplied to said water evaporator, said second tubular wall element being provided with said feed gas inlet, wherein:

said hydrogen generator is configured to cause a gas mixture containing steam and the feed gas to flow from said water evaporator to said reforming catalyst body and to reform the gas mixture into a reformed gas containing hydrogen; and

the water inlet and the feed gas inlet are configured to inject the water and the feed gas so as to contact said tubular water evaporator at locations separate from one another,

said hydrogen generator further comprising:

a tubular cover that is configured to cover said second tubular wall element and forms a double-walled pipe along with said second tubular wall element, wherein:

the reformed gas flowing out from said reforming catalyst body is caused to flow through a tubular space which is a reformed gas passage formed between said second tubular wall element and said tubular cover;

a flexible rod element is disposed at a position of the reformed gas passage to extend in a circumferential direction of said second tubular wall element;[[,]] and

the rod element is sandwiched between said second tubular wall element and said tubular cover.

18. (Withdrawn) The hydrogen generator according to claim 5, wherein said burner is oriented to cause a flame to be emitted downward from said burner.

19. (Withdrawn) The hydrogen generator according to claim 18, further comprising: a combustion tube that is connected to said burner and is configured to guide the combustion gas downward, wherein the combustion gas passage includes a first tubular combustion gas passage formed between said third tubular wall element and said first tubular wall element, and a second tubular combustion gas passage formed between said combustion tube and said third tubular wall element, and wherein the combustion gas flowing out from said combustion tube is caused to flow into the first combustion gas passage through the second combustion gas passage.

20. (Withdrawn) The hydrogen generator according to claim 19, further comprising: a second lid element that is disposed with a gap between said second lid element and an upper end of said third tubular wall element and is connected to said burner so as to close an upper end of said first tubular wall element; and
a separating element that is disposed opposite to a lower end of said combustion tube and is configured to separate an interior of said third tubular wall element.

21. (Withdrawn) The hydrogen generator according to claim 20, wherein said lid element is a flange portion formed at a base end portion of said combustion tube.

22. (Withdrawn) The hydrogen generator according to claim 1, further comprising:
a gas mixture promoting means configured to promote mixing of steam in an interior of
said water evaporator with the feed gas supplied through said feed gas inlet.

23. (Withdrawn) The hydrogen generator according to claim 22, wherein said gas
mixture promoting means includes a porous metal portion having a number of pores through
which the gas mixture flows.

24. (Withdrawn) The hydrogen generator according to claim 22, further comprising:
an annular support element that is disposed between said first and second tubular wall
elements and is configured to support said reforming catalyst body;
a first annular separating plate disposed to cover an upper end of said water evaporator;
and
a boundary space defined by said support element and said first annular separating plate;
wherein said gas mixture promoting means includes a hole formed on said first annular
separating plate, and
wherein the feed gas and the steam in the interior of said water evaporator are caused to
gather to the hole to be mixed, and flow into said boundary space.

25. (Withdrawn) The hydrogen generator according to claim 24, further comprising:
a second separating plate configured to divide said boundary space in two;

a first sub-space defined by said first and second separating plates; and
a second sub-space defined by said second separating plate and said support element,

wherein

 said gas mixing promoting means includes a bypass passage connecting an interior of
 said first sub-space to an interior of said second sub-space.

26. (Withdrawn) The hydrogen generator according to claim 25, wherein the bypass
passage includes a first pipe extending radially outward of said second tubular wall element and
a second pipe that is connected to the first pipe and extends in the axial direction of said second
tubular wall element so as to pass through said second separating plate.

27. (Withdrawn) The hydrogen generator according to claim 26, wherein the second
pipe extends in a direction perpendicular to the first pipe.

28. (Withdrawn) The hydrogen generator according to claim 25, wherein the gas
mixture is caused to flow from said first sub-space into the bypass passage and to flow into said
second sub-space toward an inner side in a circumferential direction of said second sub-space.

29. (Withdrawn) A fuel cell system comprising:
 a hydrogen generator according to claim 1; and
 a fuel cell configured to generate power using a reformed gas containing hydrogen that is
supplied from said hydrogen generator.

30. (New) The hydrogen generator according to claim 8, further comprising:
a combustion gas exhaust pipe connected to said first tubular wall element to allow the
combustion gas flowing out from the combustion gas outlet to be guided radially and downward
of said first tubular wall element.
